

Water Testing Update: As you are probably aware, Doylestown Township Municipal Authority (DTMA) was forced to shut down one of their wells in the Cross Keys area due to test results showing Perfluorinated Compounds (PFCs) above the Lifetime Health Advisory Level (HAL) of 70 ppt (parts per trillion). As a result of this contamination, PADEP has begun testing other wells within a one-mile radius of the Cross Keys Well. Well No. 5 in Summer Hill, is within that radius and DEP collected a sample on 6/22/16 for testing. This well has not been used for several years, but because of its location it was included in the testing.

The testing results indicate that the highest level of PFC's found was 8 ppt, well below the HAL of 70 ppt: Additionally, the Township has ordered sampling and testing of all of our other production wells throughout the Township to ensure that these water sources are unaffected by PFCs, and will post those results as soon as they become available.
