

**Wawa Timeline of Activity – Plumstead Twp.
Updated Jan. 6, 2006**

Jan 3 The analytical results from the Dec. 19 tests of the residential potable drinking water wells without carbon filtration systems indicated that no tested compounds were detected in any of the wells at levels exceeding state and/or federal drinking water standards. In addition, sampling of the six residential wells with carbon filters was completed and submitted to a laboratory for analysis.

Jan 4 & 5 Sampling of Wawa's seven on-site ground water monitoring wells and two observation wells was completed and the samples were submitted to a PADEP approved laboratory. Two additional ground water samples from two on-site monitor wells were collected and are being analyzed for the natural attenuation parameters. In addition, the investigation to determine potential contaminant pathways continues to move ahead and should be completed by January 16, 2006. An option to upgrade one existing carbon filtration system that predates Wawa's involvement in this issue is under review.
